(54) **RETINOID RECEPTOR AGONISTS**

(57) The invention provides a substance acting on a retinoid receptor which has a retinoid-like activity or an action of controlling retinoid activities, for example, enhancement or suppression.

Compounds represented by the following general formula (I) wherein R¹, R², R³, R⁴, and R⁵ independently represent hydrogen atom or a lower alkyl group, or two adjacent groups selected therefrom may combine together with carbon atoms of the phenyl ring to which they bind to form a 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups; and X represents a group represented by -C(R⁶)=CH-, -CH=C(R⁷)-, -N(R⁸)-CO-, -CO-N(R⁹)-, -C(=CHR¹⁰)-, -CO-, or -NR¹¹-wherein R⁶, R⁷, R⁸, R⁹, R¹⁰, and R¹¹ independently represent hydrogen atom or a lower alkyl group.

EP 1 048 659 A1

Description

Technical Field

5 **[0001]** The present invention relates to substances acting on a retinoid receptor that have physiological activities similar to those of retinoids such as retinoic acid or controlling activities on retinoid actions, and medicaments comprising said compound as an active ingredient.

Background Art

10 **[0002]** Retinoic acid (vitamin A acid), an active metabolite of vitamin A, has extremely important physiological functions, e.g., inducing differentiation of immature cells under development processes toward mature cells having specific functions, enhancement of cell proliferation, and life support action. It has been revealed that various vitamin A derivatives synthesized so far also have similar physiological functions, for example, the benzoic acid derivatives disclosed in
 15 Japanese Patent Unexamined Publication (KOKAI) Nos. (Sho)61-22047/1986 and (Sho)61-76440/1986, and the compounds described in Journal of Medicinal Chemistry, 1988, Vol. 31, No. 11, p.2182. "Retinoids" is a general term for retinoic acid and the aforementioned compounds having retinoic acid-like biological activities.

[0003] For example, it was proved that all trans retinoic acid binds as a ligand to the retinoic acid receptor (RAR) present in cellular nucleus, which belongs to the intranuclear receptor super family (Evans, R.M., Science, 240, p.889, 1988), and regulates proliferation and differentiation of animal cells or cellular mortalities (Petkovich, M., et al., Nature, 330, pp.444-450, 1987). It has also been suggested that the aforementioned compounds having the retinoic acid-like biological activities, e.g., 4-[(5,6,7,8-tetrahydro-5,5,8,8-tetramethyl-2-naphthalenyl)carbamoyl]benzoic acid: Am80, also bind to RAR in similar manners to retinoic acid to exhibit their physiological actions (see, Hashimoto, Y., Cell Struct. Funct., 16, pp.113-123, 1991; Hashimoto, Y., et al., Biochem. Biophys. Res. Commun., 166, pp.1300-1307, 1990).

25 **[0004]** Clinically, these compounds were found as useful for therapeutic and preventive treatments of vitamin A deficiency disease, hyperkeratosis of epithelial tissue, rheumatism, delayed allergy, bone diseases, leukemia and certain types of cancer. However, because of variety of biological activities of these retinoids, they are not fully satisfactory medicaments from a viewpoint of side effect. Therefore, it has been desired to create retinoids having characteristic activities and molecules controlling their activities.

30 **[0005]** As agents for controlling the activities of retinoids, there have been known benzodiazepine derivatives such as 4-[5H-2,3-(2,5-dimethyl-2,5-hexano)-5-methyldibenzo[b,e][1,4]diazepin-11-yl]benzoic acid and 4-[1,3-dihydro-7,8-(2,5-dimethyl-2,5-hexano)-2-oxo-2H-1,4-benzodiazepin-5-yl]benzoic acid (PCT/JP96/2709, International Publication WO97/11061). Although these compounds, per se, have no retinoid action or their retinoid actions are negligible, they have an action of remarkably enhancing retinoids such as retinoic acid. Therefore, they have been suggested to be useful for therapeutic and preventive treatments of vitamin A deficiency disease, hyperkeratosis of epithelial tissue, rheumatism, delayed allergy, bone diseases, leukemia, and certain types of cancer.

[0006] As for expression of physiological activities of retinoic acid, existence of retinoid X receptor (RXR, of which ligand is 9-cis-retinoic acid) has been verified. It has been revealed that the retinoid X receptor forms a dimer with the retinoic acid receptor (RAR) to induce or suppress gene transcriptions, thereby controls the expression of the physiological activities of retinoic acid (Mangelsdorf, D.J. et al., Nature, 345, pp.224-229). It has also been revealed that the retinoid X receptor (RXR) binds to the intranuclear receptor of active vitamin D₃, PPAR whose involvement in lipid metabolism is suggested, and other receptors as well as the retinoic acid receptor (RAR), thereby controls expression of actions of physiologically active substances binding to these receptors. e.g. vitamin D₃, thyroxine and the like (Mangelsdorf, D.J. et al., The Retinoids, 2nd Ed., Raven Press, pp.319-350, 1994).

45 **[0007]** As agents for controlling retinoid actions, compounds are also known to exist which have antagonistic action on retinoids and attenuate typical actions of the above retinoids (Eyrolles, L., et al., Journal of Medicinal Chemistry, 37(10), pp.1508-1517, 1994). This reference discloses that some compounds such as 4-(5H-7,8,9,10-tetrahydro-5,7,7,10,10-pentamethylbenzo[e]naphtho[2,3-b][1,4]diazepin-13-yl)benzoic acid act as antagonists of retinoids. Moreover, certain compounds including 4-(13H-10,11,12,13-tetrahydro-10,10,13,13,15-pentamethylnaphtho[2,3-b][1,2-e][1,4]diazepin-7-yl)benzoic acid have been found as a retinoid antagonist by the inventor of the present invention (specification of Japanese Patent Application No. (Hei)7-255912/1995).

55 **[0008]** It has been considered that the carboxyl groups of the retinoids such as retinoic acid and Am80, or the carboxyl groups of the aforementioned retinoid activity-enhancing compounds and the retinoid antagonists are essential functional groups for each desired biological activity. For example, it has been known that the desired biological activities are lost by the substitution of carboxyl group with a functional group such as sulfonamide and tetrazole. Some compounds having a thiazolidine skeleton such as ciglitazone and troglitazone have been suggested to act on the γ -subtype of PPAR (peroxisome proliferator-activated receptor) belonging to the intranuclear receptor super family. However, it has not been known that compounds obtained by replacing the carboxyl groups of the aforementioned physiologically

active compounds with a thiazolidine ring interact with retinoid receptors to exhibit physiological activities.

[0009] As thiazolidinedione derivatives, N-benzyl-type 2,4-thiazolidinedione derivatives having hypoglycemic action have been known (Japanese Patent Unexamined Publication (KOKAI) No. (Hei)9-48771/1997; and Abstract of the 17th Medicinal Chemistry Symposium and the 6th Annual Meeting of Medicinal Chemistry Section, pp.114-115, 1-P-30, October 27, 1997, published by the Pharmaceutical Society of Japan). However, the references neither suggest nor teach that these thiazolidinedione derivatives have retinoid-like actions, or they act as an agent for controlling retinoid activities.

Disclosure of the Invention

[0010] An object of present invention is to provide substances acting on the retinoid receptor which have a retinoid-like activity or an action of controlling the retinoid activities (for example, enhancing or suppressing activities on retinoid). Another object of the present invention is to provide medicaments which comprise said compound as an active ingredient.

[0011] The inventor of the present invention conducted various studies to achieve the foregoing objects, and as a result, they found that thiazolidine compounds represented by the following general formulas had retinoic acid-like biological activities, or an action for enhancing or suppressing the activities of retinoids. The present invention was achieved on the basis of these findings.

[0012] The present invention thus provides compounds represented by the following general formula (I):

wherein R^1 , R^2 , R^3 , R^4 , and R^5 independently represent hydrogen atom or a lower alkyl group, or two adjacent groups selected therefrom may combine together with carbon atoms of the phenyl ring to which they bind to form a 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups; and X represents a group represented by $-C(R^6)=CH-$, $CH=C(R^7)-$, $-N(R^8)-CO-$, $-CO-N(R^9)-$, $-C(=CHR^{10})-$, $-CO-$, or $-NR^{11}-$ wherein R^6 , R^7 , R^8 , R^9 , R^{10} , and R^{11} independently represent hydrogen atom or a lower alkyl group, and compounds represented by the following general formula (II):

wherein R^{21} , R^{22} , R^{23} , and R^{24} independently represent hydrogen atom or a lower alkyl group, or two adjacent groups selected therefrom may combine together with carbon atoms of the phenyl ring to which they bind to form a 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups; and R^{25} represents hydrogen atom

or a lower alkyl group, or salts thereof.

[0013] According to another aspect of the present invention, there are provided medicaments comprising the compounds represented by aforementioned general formulas or physiologically acceptable salts thereof, or hydrates thereof or solvates thereof. These medicaments are useful as agents having retinoid-like actions or agents for controlling retinoid activities (preferably agents for enhancing retinoid activities or those for suppressing retinoid activities).

[0014] According to further aspects of the present invention, there are provided use of the aforementioned substances for the manufacture of the aforementioned medicaments; and methods for therapeutic and/or preventive treatments of a disease in which a receptor belonging to the intranuclear receptor super family (Evans, R.M., Science, 240, p.889, 1988), preferably a retinoid receptor (RAR and/or RXR) is involved, which comprises the step of administering an effective amount of the aforementioned substances to a mammal including a human.

Most Preferred Embodiments to Carry out the Invention

[0015] In the aforementioned general formula (I), R^1 , R^2 , R^3 , R^4 , and R^5 independently represent hydrogen atom or a lower alkyl group. As the lower alkyl group, a linear or branched alkyl group having about 1 to 6 carbon atoms, preferably 1 to 4 carbon atoms can be used. For example, methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, sec-butyl group, tert-butyl group and the like may be used.

[0016] Two adjacent groups selected from the group consisting of R^1 , R^2 , R^3 , R^4 , and R^5 may combine together with carbon atoms of the phenyl ring to which they bind to form one or two, preferably one 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups. As the alkyl group that may be present on the ring(s), a linear or branched alkyl group having about 1 to 6 carbon atoms, preferably 1 to 4 carbon atoms may be used. For example, methyl group, ethyl group and the like may be used, and preferably 2 to 4 methyl groups, more preferably four methyl groups, may be present on the ring(s). For example, R^2 and R^3 together with the phenyl ring to which R^2 and R^3 bind may preferably form 5,6,7,8-tetrahydronaphthalene ring, 5,5,8,8-tetramethyl-5,6,7,8-tetrahydronaphthalene ring or the like.

[0017] X represents any one of groups represented by $-C(R^6)=CH-$, $-CH=C(R^7)-$, $-N(R^8)-CO-$, $-CO-N(R^9)-$, $-C(=CHR^{10})-$, $-CO-$, or $-NR^{11}-$. In these groups, R^6 , R^7 , R^8 , R^9 , R^{10} , and R^{11} independently represent hydrogen atom or a lower alkyl group. As the lower alkyl group, for example, a linear or branched alkyl group having 1 to 4 carbon atoms may be used. More specifically, methyl group, ethyl group and the like are preferably used. The substituting position of X on the phenyl group of the benzylidenethiazolidinedione moiety is not particularly limited. Para-substitution or meta-substitution may be preferred.

[0018] In the aforementioned general formula (II), R^{21} , R^{22} , R^{23} and R^{24} independently represent hydrogen atom or a lower alkyl group. As the lower alkyl group, a linear or branched alkyl group having about 1 to 6 carbon atoms, preferably 1 to 4 carbon atoms may be used. For example, methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, sec-butyl group, tert-butyl group and the like may be used. R^{25} represents hydrogen atom or a lower alkyl group. As the lower alkyl group, for example, a linear or branched alkyl group having 1 to 4 carbon atoms may be used. More specifically, methyl group, ethyl group and the like may preferably be used.

[0019] Two adjacent groups selected from the group consisting of R^{21} , R^{22} , R^{23} , and R^{24} may combine together with carbon atoms of the phenyl ring to which they bind to form one or two, preferably one 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups. As the alkyl group that may be present on the ring(s), a linear or branched alkyl group having about 1 to 6 carbon atoms, preferably 1 to 4 carbon atoms, may be used. For example, methyl group, ethyl group and the like may be used, and preferably 2 to 4 methyl groups, more preferably four methyl groups, may be present on the ring(s). For example, R^{22} and R^{23} together with the phenyl ring to which R^{22} and R^{23} bind may preferably form 5,6,7,8-tetrahydronaphthalene ring or 5,5,8,8-tetramethyl-5,6,7,8-tetrahydronaphthalene ring.

[0020] The aforementioned compounds may form base addition salts. For example, they may exist as metal salts such as sodium salts, potassium salts, magnesium salts and calcium salts, ammonium salts, organic amine salts such as triethylamine salts and ethanolamine salts and the like. Among those salts, physiologically acceptable salts can be used as the active ingredients of the medicaments of the present invention. The aforementioned compounds may have one or two asymmetric carbon atoms depending on the types of substituents. Any optical isomers based on the asymmetric carbon atom(s), any mixtures of optical isomers, racemates, diastereomers based on two or more asymmetric carbon atoms, any mixtures of the diastereomers and the like fall within the scope of the present invention. Furthermore, geometrical isomers based on cis- or trans-configuration of one or more double bonds and any mixtures of the geometrical isomers, and any hydrates and solvates of the compounds in free form or the compounds in the forms of salts also fall within the scope of the present invention.

[0021] Among the compounds of the present invention, preferred compounds include those listed below. However, the compounds of the present invention or compounds that can be utilized as the active ingredients of the medicaments of the present invention are not limited to the following compounds. In the following description, "para" and "meta" indi-

cate that the substituting position of X on the phenyl group of the benzylidenethiazolidinedione moiety is para-position or meta-position, respectively, and Me represents methyl group.

**TZ91**

[0022] As for the preparations of the compounds of the aforementioned formulas (I) and (II), synthetic examples of the aforementioned typical compounds are specifically detailed in the examples given in the specification. Therefore, those skilled in the art will be able to readily prepare any compounds falling within the compounds of the present invention represented by the aforementioned formulas (I) and (II) by referring to those examples, or if necessary, appropriately modifying or altering the disclosed methods.

[0023] The compounds of the aforementioned formulas (I) and (II) can interact with a retinoid receptor (the term "retinoid receptor" used in the specification encompasses the retinoic acid receptors RAR and RXR, and the term means one or more of receptors with which a retinoid such as retinoic acid can interact), and they, per se, exhibit a retinoid-like physiological activities as an agonist, or have an action for enhancing or suppressing the physiological activities of retinoids.

[0024] Therefore, the medicaments comprising the aforementioned compound as an active ingredient are useful as agents having retinoid-like activities or agents for controlling retinoid activities. Which of the actions the compound of the aforementioned formula (I) or (II) possesses can be easily determined by a method described in detail in the exam-

ples of the specification. An evaluation for compounds enhancing retinoid activities is described in International Publication WO97/11061 (PCT/JP96/2709), and an evaluation for compounds suppressing retinoid activities is described in Eyrolles, L., et al., Journal of Medicinal Chemistry, 37 (10), pp.1508-1517, 1994, and the specification of Japanese Patent Application No. (Hei)7-255912/1995.

[0025] Among the aforementioned compounds, those exhibiting retinoid-like activities have, for example, cell differentiation activity, cell proliferation enhancing activity, life supporting activity and the like, and they can be used as active ingredients of medicaments for preventive or therapeutic treatments of vitamin A deficiency disease, hyperkeratosis of epithelial tissue, psoriasis, allergic diseases, immunological diseases such as rheumatism, bone diseases, leukemia, or cancers.

[0026] Among the aforementioned compounds, those enhancing retinoid activities, per se, have substantially no retinoid-like activity, or they have slight or moderate retinoid-like activities. However, where those compounds are allowed to coexist with a retinoid such as retinoic acid, the physiological activities of the retinoid (typical examples include cell differentiation activity, cell proliferation enhancing activity, life supporting activity and the like) are remarkably enhanced.

[0027] Although it is not intended to be bound by any specific theory, where the compound enhancing retinoid activities, per se, exhibit retinoid activities, synergistic actions are achieved. Therefore, where retinoids such as retinoic acid or the aforementioned compounds having retinoic acid-like biological activities (for example, 4-[(5,6,7,8-tetrahydro-5,5,8,8-tetramethyl-2-naphthalenyl)carbamoyl]benzoic acid: Am80) are administered as medicaments for the preventive or therapeutic treatments of vitamin A deficiency disease, hyperkeratosis of epithelial tissue, psoriasis, allergic diseases, immunological diseases such as rheumatism, bone diseases, leukemia, or cancers, the compounds enhancing retinoid activities can be used as agents that enhance the activities of the retinoids.

[0028] Even when retinoids are not administered for the preventive and therapeutic treatments of the aforementioned diseases, the compounds enhancing retinoid activities can increase the activities of retinoic acid that inherently exists in living bodies, and thus the compounds may be administered as medicaments for the purpose of the preventive and therapeutic treatments of the aforementioned diseases. Furthermore, the aforementioned compounds may be used, in addition to the enhancement of the activities of retinoids, to enhance activities of physiologically active substances such as, for example, steroid compounds, vitamin D compounds including vitamin D₃, thyroxine and the like which bind to receptors belonging to the intranuclear receptor super family present in cellular nucleus to exhibit their physiological activities (Evans, R.M., Science, 240, p.889, 1988). They are useful as medicaments for preventive or therapeutic treatments of, for example, diabetes, arteriosclerosis, hyperlipidemia, hypercholesterolemia, bone diseases, rheumatism, immunological diseases and the like.

[0029] As the intranuclear receptors, for example, the intranuclear receptor for active vitamin D₃, the PPAR involved in lipid metabolism, the thyroxine receptor, the COUP and the like have been known (as for these receptors, see, Mangelsdorf, D.J. et al., The Retinoids, 2nd Ed., Ravan Press, pp.319-350, 1994). It has been revealed that these receptors bind to the retinoid X receptor (RXR) to have the aforementioned physiologically active substances exhibit their activities.

[0030] Among the aforementioned compounds, those suppressing retinoid activities have an action of markedly suppressing the physiological activities of retinoids (cell differentiation activity, cell proliferation enhancing activity, life supporting activity and the like). Although it is not intended to be bound by any specific theory, it is believed that compounds having such an action bind to retinoid X receptor (RXR), which forms a dimer with the retinoic acid receptor (RAR), thereby control the expression of the physiological activity of retinoids such as retinoic acid. These compounds are useful for preventive and/or therapeutic treatments of endogenous hypervitaminosis of vitamin A caused by excessive vitamin A in vitro, or exogenous hypervitaminosis of vitamin A caused by retinoic acid or a compound having retinoic acid-like biological activities (e.g., 4-[(5,6,7,8-tetrahydro-5,5,8,8-tetramethyl-2-naphthalenyl)carbamoyl]benzoic acid: Am80 or the like) which is administered for therapeutic or preventive treatment of vitamin A deficiency disease, hyperkeratosis of epithelial tissue, psoriasis, allergic diseases, immunological diseases such as rheumatism, bone diseases, leukemia, or cancers.

[0031] Cancers such as leukemia can be treated by administering the compounds suppressing retinoid activities, per se, alone or in combination with other retinoid or an antitumor agent. The aforementioned compounds can suppress activities of substances that bind to a receptor belonging to the intranuclear receptor super family present in the nucleus of cells (Evans, R.M., Science, 240, p.889, 1988) to express physiological activities, for example, steroid compounds, vitamin D compounds such as vitamin D₃, thyroxine and orphan receptors whose ligands are unknown. Accordingly, the aforementioned compounds can also be used for controlling the expression of the physiological activities of these substances. The compounds suppressing retinoid activities which bind to the retinoid X receptor (RXR) can be thus used for, for example, preventive and/or therapeutic treatments of diseases with abnormalities of biological activities in which one or more of receptors belonging to the intranuclear receptor super family involve.

[0032] The medicament of the present invention comprises, as an active ingredient, at least one substance selected from the group consisting of the compounds represented by the, aforementioned formula (I) and salts thereof,

and hydrates thereof and solvates thereof, and substances selected from the group consisting of the compounds represented by the aforementioned formula (II) and salts thereof, and hydrates thereof and solvates thereof. As the medicament of the present invention, the aforementioned substance, per se, may be administered. However, a pharmaceutical composition for oral administration or parenteral administration may preferably be administered which can be prepared by a method well known to those skilled in the art. Examples of the pharmaceutical compositions suitable for oral administrations include, for example, tablets, capsules, powders, subitized granules, granules, liquids, syrups and the like. Examples of the pharmaceutical compositions suitable for parenteral administrations include, for example, injections, suppositories, inhalants, eye drops, nasal drops, ointments, creams, patches and the like.

[0033] The aforementioned pharmaceutical compositions may be prepared by the addition of pharmacologically and pharmaceutically acceptable additives. Examples of pharmacologically and pharmaceutically acceptable additives include, (or example, excipients, disintegrators and disintegrating aids, binders, lubricants, coating agents, colorants, diluents, base materials, dissolving agents and dissolving aids, isotonic agents, pH modifiers, stabilizers, propellants, adhesives and the like.

[0034] The doses of the medicaments of the present invention are not particularly limited, and they can suitably be selected depending on nature of the action, strength of the action and the like, and also can suitably be increased or decreased depending on various factors to be generally considered, for example, the body weight or age of a patient, the kind or symptom of a disease, an administration route and the like. In general, as for the medicaments containing compounds having retinoid-like activities as active ingredients, doses may be appropriately chosen so as to be similar to the doses of retinoic acid used as a medicament, or by making reference to the doses. For example, for oral administrations, they may be used in a dose of from 0.01 to 1,000 mg per day for an adult. Also as for the medicaments comprising the compounds enhancing retinoid activities or suppressing retinoid activities, doses can be similarly chosen. For example, for oral administrations, the medicament may be used in a dose of from 0.01 to 1,000 mg per day for an adult.

Examples

[0035] The present invention will be more specifically explained with reference to the following examples. However, the scope of the present invention is not limited to these examples. The compound numbers in the examples correspond to those of the compounds described above as preferred examples and those in the synthetic schemes shown below.

Example 1: Synthesis of TZ91

[0036] 4-[2-(5,6,7,8-Tetramethyl-5,5,8,8-tetrahydro-2-naphthyl)propenyl]benzaldehyde (24 mg, 0.072 mmol), 2,4-thiazolidinedione (10 mg, 0.085 mmol) and piperidine (5 mg, 0.058 mmol) were dissolved in ethanol (2.5 ml) and the solution was refluxed overnight. The reaction mixture was poured into 1 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with water and dehydrated over Na_2SO_4 . The solvent was evaporated, and the residue was recrystallized from methanol to obtain TZ91 (quantitative).

[0038] 3,5-Di-tert-butylbenzoic acid (I-1) (1.00 g, 4.27 mmol) was suspended in thionyl chloride (2.50 g, 21.0 mmol) and anhydrous benzene (12 ml) and the mixture was refluxed for 14 hours. Thionyl chloride was evaporated, and the residue was added with methyl p-aminobenzoate (645 mg, 4.27 mmol), and then suspended in anhydrous benzene (30 ml) and anhydrous pyridine (1 ml). The mixture was stirred at room temperature for 1.5 hours. The reaction mixture was added with ice water and 2 N hydrochloric acid, and extracted with ethyl acetate. The organic layer was washed with brine, dehydrated over MgSO₄, and then concentrated. The residue was purified by silica gel column chromatography (methylene chloride) to obtain Compound I-2 (1.03 g, 66%).

¹H-NMR (400 MHz, CDCl₃): 8.06 (d, 2H, J=8.8Hz), 7.90 (br s, 1H), 7.75 (d, 2H, J=8.8Hz), 7.66 (d, 2H, J=1.5Hz), 7.64 (t, 1H, J=1.8Hz), 3.92 (s, 3H), 1.37 (s, 18H).

[0039] Compound I-2 (1.02 g, 2.78 mmol) was dissolved in THF (30 ml), and gradually added with DIBAL (8.34 ml, 1 M solution in toluene, 8.34 mmol) at -20°C. After 30 minutes, the reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over MgSO₄, and the solvent was concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:1) to obtain Compound I-3 (786 mg, 83%).

¹H-NMR (400 MHz, CDCl₃): 7.78 (br s, 1H), 7.67 (d, 2H, J=1.8Hz), 7.65 (d, 2H, J=8.8Hz), 7.62 (t, 1H, J=1.8Hz), 7.38 (d, 2H, J=8.5Hz), 4.69 (d, 2H, J=5.9Hz), 1.37 (s, 18H).

[0040] Compound I-3 (780 mg, 2.30 mmol) was dissolved in methanol-free methylene chloride (22 ml), and the solution was added with PCC (992 mg, 4.60 mmol) and stirred at room temperature for 2.5 hours. The reaction mixture was concentrated, and the residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:4) to obtain compounds I-4 (704 mg, 91%).

¹H-NMR (400 MHz, CDCl₃): 9.96 (s, 1H), 7.97 (br s, 1H), 7.92 (d, 2H, J=8.4Hz), 7.85 (d, 2H, J=8.4Hz), 7.67 (d, 2H, J=1.8Hz), 7.66 (t, 1H, J=1.8Hz), 1.38 (s, 18H).

[0041] Compound I-4 (150 mg, 0.45 mmol) and 2,4-thiazolidinedione (52 mg, 0.45 mmol) were suspended in anhy-

drous toluene (10 ml), and the suspension was added with a solution of piperidine (11 mg, 0.13 mmol) and acetic acid (8 mg, 0.13 mmol) dissolved in anhydrous toluene (1.4 ml), and then refluxed at 120°C for 3.5 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over MgSO_4 , and the solvent was concentrated to obtain TZ151 (194 mg, 99%).

[0057]

[0058] 5,6,7,8-Tetrahydro-5,5,8,8-tetramethyl-2-naphthoic acid (V-1, 700 mg, 3.01 mmol) was suspended in thionyl chloride (8 ml), and the mixture was added with one drop of DMF, and then stirred at room temperature for 2 hours. The thionyl chloride was evaporated, and the residue was added with methyl p-aminobenzoate (450 mg, 2.98 mmol) and 4-dimethylaminopyridine (5 mg), and then the mixture was dissolved in anhydrous pyridine (20 ml) and stirred at room temperature overnight. The reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with 2 N hydrochloric acid, water and brine, dehydrated over Na₂SO₄, and concentrated to

obtain Compound V-2 (97%).

[0059] Compound V-2 (183 mg, 0.50 mmol) was dissolved in THF (10 ml), and the solution was gradually added with DIBAL (1.5 ml, 1 M solution in toluene, 1.5 mmol) at -45°C. After 30 minutes, the reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over Na₂SO₄, and the solvent was concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : methylene chloride = 1:3) to obtain Compound V-3 (142 mg, 84%).

¹H-NMR (400 MHz, CDCl₃): 7.86 (d, 1H, J=2.2Hz), 7.78 (br s, 1H), 7.63 (d, 2H, J=8.4Hz), 7.55 (dd, 1H, J=2.0, 8.2Hz), 7.40 (d, 1H, J=8.8Hz), 7.37 (d, 2H, J=8.4Hz), 4.68 (s, 2H), 1.72 (s, 4H), 1.33 (s, 6H), 1.31 (s, 6H).

[0060] Compound V-3 (140 mg, 0.42 mmol) was dissolved in methanol-free methylene chloride (10 ml), and the solution was added with PCC (100 mg, 0.46 mmol) and stirred at room temperature for one hour. The reaction mixture was concentrated and purified by silica gel column chromatography (methylene chloride) to obtain Compound V-4 (99 mg, 71%).

¹H-NMR (400 MHz, CDCl₃): 9.95 (s, 1H), 7.92 (br s, 1H), 7.91 (d, 2H, J=8.8Hz), 7.87 (d, 1H, J=1.8Hz), 7.84 (d, 2H, J=8.8Hz), 7.56 (dd, 1H, J=2.0, 8.3Hz), 7.43 (d, 1H, J=8.4Hz), 1.73 (s, 4H), 1.34 (s, 6H), 1.32 (s, 6H).

[0061] Compound V-4 (73 mg, 0.22 mmol) and 2,4-thiazolidinedione (30 mg, 0.26 mmol) were suspended in anhydrous toluene (4 ml). Piperidine (173 μl) and acetic acid (100 μl) were dissolved in anhydrous toluene (25 ml), and the above suspension was added with the resulting solution (3 ml) and then refluxed at 120°C for 2 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with 2 N hydrochloric acid and water, and dehydrated over Na₂SO₄. The solvent was concentrated to obtain TZ181 (100 mg, quantitative).

Example 20: Synthesis of TZ201

[0071]

[0072] The ester compound VII-1 (110 mg, 0.24 mmol) was dissolved in THF (10 ml), and the solution was gradually added with DIBAL (1.5 ml) (1 M solution in toluene, 1.5 mmol) at -20°C. After 3 hours, the reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over Na₂SO₄, and the solvent was concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : methylene chloride = 1:4) to obtain Compound VII-2 (100 mg, 97%).

¹H-NMR (400 MHz, CDCl₃): 7.81 (d, 2H, J= 8.4Hz), 7.40 (d, 2H, J=8.4Hz), 7.31 (d, 1H, J=7.3Hz), 7.13 (dt, 1H, J=1.8, 7.3Hz), 7.08 (dt, 1H, J=1.5, 7.3Hz), 6.97 (dd, 1H, J=1.5, 7.7Hz), 6.94 (s, 1H), 6.92 (s, 1H), 4.77 (d, 2H, J=4.4Hz), 3.25 (s, 3H), 1.64 (m, 4H), 1.32 (s, 3H), 1.26 (s, 3H), 1.14 (s, 3H), 1.05 (s, 3H).

[0073] Compound VII-2 (100 mg, 0.24mmol) was dissolved in methanol-free methylene chloride (10 ml), and the solution was added with PCC (60 mg, 0.28 mmol) and stirred at room temperature for one hour. The reaction mixture was concentrated and purified by silica gel column chromatography (ethyl acetate : methylene chloride =1:50) to obtain Compound VII-3 (72 mg, 72%).

¹H-NMR (400 MHz, CDCl₃): 10.10 (s, 1H), 7.98 (d, 2H, J=8.0Hz), 7.92 (d, 2H, J=8.8Hz), 7.32 (d, 1H, J=7.7Hz), 7.17 (dt, 1H, J=1.5, 8.0Hz), 7.10 (dt, 1H, J=1.5, 7.7Hz), 6.98 (dd, 1H, J=1.5, 8.1Hz), 6.93 (s, 1H), 6.86 (s, 1H), 3.26 (s, 3H), 1.65 (m, 4H), 1.32 (s, 3H), 1.27 (s, 3H), 1.12 (s, 3H), 1.04 (s, 3H).

[0074] Compound VII-3 (70 mg, 0.17 mmol) and 2,4-thiazolidinedione (20 mg, 0.17 mmol) were suspended in

anhydrous toluene (4 ml). Piperidine (173 μ l) and acetic acid (100 μ l) were dissolved in anhydrous toluene (25 ml). The above suspension was added with the resulting solution (2.5 ml) and then refluxed at 120°C for 2 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with 2 N hydrochloric acid and water, and dehydrated over Na₂SO₄, and the solvent was concentrated to obtain TZ201 (73 mg, 84%).

TZ201: Red needles (ethyl acetate/methanol); mp >300°C; ¹H-NMR (400 MHz, DMSO-d₆, 30°C): 12.62 (s, 1H), 7.83 (s, 1H), 7.82 (d, 2H, J=8.7Hz), 7.69 (d, 2H, J=8.3Hz), 7.16-7.22 (m, 2H), 7.09 (m, 2H), 7.06 (s, 1H), 6.90 (s, 1H), 3.21 (s, 3H), 1.62 (m, 4H), 1.30 (s, 3H), 1.26 (s, 3H), 1.13 (s, 3H), 1.03 (s, 3H); Anal. Example 21: Synthesis of TZ221

[0075]

[0076] 1,2,3,4-Tetrahydro-1,1,4,4-tetramethylnaphthalene (VIII-1, 1.00g, 5.32 mmol) and terephthalic acid monomethyl ester chloride (1.06 g, 5.32 mmol) were dissolved in methanol-free methylene chlorides (20 ml), and the solution was added with aluminium chloride (1.42 g, 10.64 mmol) with ice cooling, and then refluxed for 30 minutes. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with water and brine, dehydrated over MgSO₄, and concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1:20, then 1:10) to obtain Compound VIII-2 (1.30 g, 70%).

¹H-NMR (400 MHz, CDCl₃): 8.14 (d, 2H, J=8.4Hz), 7.83 (d, 2H, J=8.4Hz), 7.78 (d, 1H, J=1.8Hz), 7.53 (dd, 1H, J=8.4, 1.8Hz), 7.40 (d, 1H, J=8.0Hz), 3.97 (s, 3H), 1.72 (s, 4H), 1.32 (s, 6H), 1.29 (s, 6H).

[0077] Compound VIII-2 (1.20 g, 3.43 mmol) was dissolved in THF (15 ml), and gradually added with DIBAL (13.7ml, 1 M solution in toluene, 13.7 mmol) dropwise while stirring was continued at -78°C under argon atmosphere. After one hour, the reaction mixture was poured into 1 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with brine, dehydrated over MgSO₄, and concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1:3). The resulting product was found to be obtained by reduction of only the ketone group (937.5 mg). Accordingly, the resulting product was further reduced by DIBAL at 0°C for 30 minutes and subjected to the same post-treatment to obtain Compound VIII-3 (896 mg, 81%).

¹H-NMR (400 MHz, CDCl₃): 7.40 (d, 2H, J=8.1Hz), 7.34 (m, 3H), 7.25 (d, 1H, J=8.0Hz), 7.05 (dd, 1H, J=8.0, 1.8Hz), 5.80 (s, 1H), 4.68 (s, 2H), 2.15 (br s, 1H), 1.67 (s, 4H), 1.26 (s, 6H), 1.25 (s, 6H).

[0078] Alumina (4.70 g) and PCC (2.65 g, 12.3 mmol) were suspended in methanol-free methylene chloride (10 ml) under argon atmosphere, and the suspension was gradually added with Compound VIII-3 (810 mg, 2.50 mmol) dissolved in methanol-free methylene chloride (10 ml). After one hour, the reaction mixture was concentrated and purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:7) to obtain Compound VIII-4 (798 mg, 99.7%).

¹H-NMR (400 MHz, CDCl₃): 10.14 (s, 1H), 8.00 (d, 2H, J=8.4Hz), 7.91 (d, 2H, J=8.1Hz), 7.80 (d, 1H, J=1.8Hz), 7.53 (dd, 1H, J=8.4, 2.2Hz), 7.41 (d, 1H, J=8.1Hz), 1.73 (s, 4H), 1.32 (s, 6H), 1.30 (s, 6H).

[0079] Compound VIII-4 (790 mg, 2.47 mmol) and 2,4-thiazolidinedione (319 mg, 2.72 mmol) were suspended in anhydrous toluene (20 ml), and the suspension was added with a solution of piperidine (63 mg, 0.74 mmol) and acetic acid (45 mg, 0.74 mmol) dissolved in anhydrous toluene (8 ml), and refluxed at 120°C for 3 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with brine, dehydrated over MgSO₄, and then concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1:2) to obtain TZ221 (328 mg, 32%).

[0091]

[0092] 3,5-Di-*tert*-butylaniline (X-1, 1.00 g, 4.88 mmol), ethyl 4-iodobenzoate (1.37 g, 4.95 mmol), and *tert*-BuONa (549 mg, 5.68 mmol) were dissolved in anhydrous toluene (15 ml), and the solution was added with tris(dibenzylideneacetone)dipalladium(0) (91 mg) and (*R*)-BINAP (139 mg, 0.22 mmol) under argon atmosphere, and stirred at 100°C for one hour. The reaction mixture was cooled to room temperature, and extracted with ether. The organic layer was washed with brine, dehydrated over MgSO₄, and then concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : *n*-hexane = 1:6) to obtain Compound X-2 (0.94 g, 55%).

¹H-NMR (400 MHz, CDCl₃): 7.92 (d, 2H, J=8.8Hz), 7.14 (t, 1H, J=1.8Hz), 7.02 (d, 2H, J=1.8Hz), 6.96 (d, 2H, J=8.8Hz), 4.33 (q, 2H, J=7.3Hz), 1.37 (t, 3H, J=7.3Hz), 1.32 (s, 18H).

[0093] Compound X-2 (935 mg, 2.65 mmol) was dissolved in anhydrous benzene (10 ml), and the solution was added with acetyl chloride (249 mg, 3.18 mmol) and anhydrous pyridine (0.5 ml), and then stirred at room temperature for 5 hours. The reaction mixture was added with ice water and extracted with ethyl acetate. The organic layer was washed with diluted hydrochloric acid and brine, dehydrated over MgSO₄, and concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : *n*-hexane = 1:4) to obtain Compound X-3 (956 mg, 92%).

¹H-NMR (400 MHz, CDCl₃): 7.99 (d, 2H, J=8.4Hz), 7.39 (s, 1H), 7.34 (d, 2H, J=8.8Hz), 7.05 (d, 2H, J=1.8Hz), 4.35 (q, 2H, J=7.3Hz), 2.04 (s, 3H), 1.37 (t, 1H, J=7.0Hz), 1.30 (s, 18H).

[0094] Compound X-3 (950 mg, 2.40 mmol) was dissolved in THF (8 ml) under argon substitution, and the solution was gradually added dropwise with DIBAL (7.2 ml, 1 M solution in toluene, 7.20 mmol) with stirring at -78°C. After 15 minutes, the reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer

was washed with brine, dehydrated over MgSO_4 , and then concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:2) to obtain Compound X-4 (412 mg, 55%).

$^1\text{H-NMR}$ (400 MHz, CDCl_3): 7.27 (m, 3H), 7.04 (m, 3H), 6.96 (d, 2H, $J=1.5\text{Hz}$), 4.61 (s, 2H), 1.31 (s, 18H).

[0095] Compound X-4 (400 mg, 1.29 mmol) was dissolved in methanol-free methylene chloride (8 ml), and the solution was added with active MnO_2 (1.32 g, 85%, 12.9 mmol), and stirred at room temperature for 12 hours. The reaction mixture was filtered, and the filtrate was concentrated and purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:8, then 1:4) to obtain Compound X-5 (184 mg, 46%).

$^1\text{H-NMR}$ (400 MHz, CDCl_3): 9.78 (s, 1H), 7.74 (d, 2H, $J=8.8\text{Hz}$), 7.20 (t, 1H, $J=1.8\text{Hz}$), 7.05 (d, 1H, $J=1.8\text{Hz}$), 6.99 (d, 2H, $J=8.4\text{Hz}$), 6.17 (s, 1H), 1.33 (s, 18H).

[0096] NaH (34 mg, 60%, 0.87 mmol) was washed with n-hexane, and suspended in DMF (1 ml). The suspension was added with Compound X-5 (180 mg, 0.58 mmol) dissolved in DMF (5 ml) and stirred at room temperature for 15 minutes. The reaction mixture was added with CH_3I (0.14 ml, 2.25 mmol), and further stirred for one hour. After DMF was evaporated, the residue was added with water and extracted with methylene chloride. The organic layer was washed with brine, dehydrated over MgSO_4 , and concentrated. Then, the residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:6) to obtain Compounds X-6 (173 mg, 92%).

$^1\text{H-NMR}$ (400 MHz, CDCl_3): 9.75 (s, 1H), 7.68 (d, 2H, $J=8.8\text{Hz}$), 7.33 (t, 1H, $J=1.8\text{Hz}$), 7.05 (d, 2H, $J=1.8\text{Hz}$), 6.74 (d, 2H, $J=8.8\text{Hz}$), 3.40 (s, 3H), 1.33 (s, 18H).

[0097] Compound X-6 (170 mg, 0.53 mmol) and 2,4-thiazolidinedione (62 mg, 0.53 mmol) were suspended in anhydrous toluene (4 ml), and the suspension was added with a solution of piperidine (13.4 mg, 0.16 mmol) and acetic acid (9.5 mg, 0.16 mmol) dissolved in anhydrous toluene (1.6 ml), and refluxed at 120°C for 1.5 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with brine, dehydrated over MgSO_4 , and then concentrated. Then, the residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:3) to obtain TZ315 (197 mg, 89%).

TZ315: Yellow needles (ethyl acetate/n-hexane); mp 254°C ; $^1\text{H-NMR}$ (400 MHz, CDCl_3): 8.11 (br s, 1H), 7.77 (s, 1H), 7.34 (m, 3H), 7.04 (d, 1H, $J=1.8\text{Hz}$), 6.77 (d, 2H, $J=8.8\text{Hz}$), 3.39 (s, 3H), 1.33 (s, 18H); Anal. [0099] Methyl 3-iodobenzoate (1.37 g, 5.23 mmol), 3,5-di-*tert*-butylaniline (X-1) (1.00 g, 4.88 mmol), and *tert*-BuONa (549 mg, 5.68 mmol) were dissolved in anhydrous toluene (15 ml), and the solution was added with tris(dibenzylideneacetone)dipalladium(0) (91 mg) and (R)-BINAP (139 mg, 0.22 mmol) under argon substitution, and stirred at 80°C for one hour. The reaction mixture was cooled to room temperature, and extracted with ether. The organic layer was washed with brine, dehydrated over MgSO₄, and concentrated. The residue was then purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:8) to obtain Compound XI-1 (crude product, 514 mg, 31%).

¹H-NMR (400 MHz, CDCl₃): 7.87 (d, 1H, J=7.7Hz), 7.75 (m, 1H), 7.53 (m, 1H), 7.29 (t, 1H, J=7.7Hz), 7.07 (t, 1H, J=1.5Hz), 6.98 (d, 2H, J=1.5Hz), 3.88 (s, 3H), 1.32 (s, 18H).

[0100] NaH (88 mg, 60%, 2.21 mmol) was washed with n-hexane, and suspended in DMF (1 ml). The suspension was added with Compound XI-1 (crude product, 500 mg, 1.47 mmol) dissolved in DMF (8 ml), and stirred at room temperature for 15 minutes. The reaction mixture was added with methyl iodide (0.35 ml, 5.62 mmol) and stirred for 3 hours. After DMF was evaporated, the residue was added with water and extracted with methylene chloride. The organic layer was washed with brine and dehydrated over MgSO₄, and the solvent was evaporated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:10) to obtain Compound XI-2 (180 mg, 34.5%).

¹H-NMR (400 MHz, CDCl₃): 7.60 (m, 1H), 7.47 (d, 1H, J=7.7Hz), 7.23 (t, 1H, J=8.0Hz), 7.17 (t, 1H, J=1.8Hz), 7.04 (m, 1H), 6.99 (d, 2H, J=1.8Hz), 3.92 (s, 3H), 3.88 (s, 3H), 1.30 (s, 18H).

[0101] Compound XI-2 (170 mg, 0.48 mmol) was dissolved in THF (4 ml) under argon substitution, and gradually added dropwise with DIBAL (1.44 ml, 1 M solution in toluene, 1.44 mmol) with stirring at -78°C. After 30 minutes, the reaction mixture was poured into 2 N hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over MgSO₄, and the solvent was concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:3) to obtain Compound XI-3 (130 mg, 83%).

¹H-NMR (400 MHz, CDCl₃): 7.20 (t, 1H, J=1.8Hz), 7.14 (t, 1H, J=1.8Hz), 6.98 (d, 2H, J=1.8Hz), 6.92 (s, 1H), 6.81 (d, 2H, J=8.1Hz), 4.62 (d, 2H, J=5.9Hz), 3.34 (s, 3H), 1.30 (s, 18H).

[0102] Compound XI-3 (125 mg, 0.38 mmol) was dissolved in methanol-free methylene chloride (4 ml), and the solution was added with active MnO₂ (394 mg, 85%, 3.85 mmol) and stirred at room temperature for 6.5 hours. The reaction mixture was filtered, and the filtrate was concentrated. Then, the residue was purified by silica gel column chro-

matography (ethyl acetate : n-hexane = 1:6) to obtain Compound XI-4 (43.5 mg, 35%, 51 mg of XI-3 was collected).

¹H-NMR (400 MHz, CDCl₃): 9.92 (s, 1H), 7.35 (m, 1H), 7.32 (t, 1H, J=7.7Hz), 7.27 (m, 1H), 7.23 (t, 1H, J=1.8Hz), 7.07 (m, 1H), 7.02 (d, 1H, J=1.8Hz), 3.37 (s, 3H), 1.31 (s, 18H).

[0103] Compound XI-4 (65 mg, 0.20 mmol) and 2,4-thiazolidinedione (23 mg, 0.20 mmol) were suspended in anhydrous toluene (3 ml), and the suspension was added with a solution of piperidine (5.1 mg, 0.060 mmol) and acetic acid (3.6 mg, 0.060 mmol) dissolved in anhydrous toluene (0.6 ml), and refluxed at 120°C for 3.5 hours. The reaction mixture was poured into ice water and extracted with ethyl acetate. The organic layer was washed with brine and dehydrated over MgSO₄, and then the solvent was concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 1:2) to obtain TZ317 (88 mg, quantitative).

[0139] Cell differentiation-inducing activity of each compound of the present invention used alone, and effect on cell differentiation-inducing activity of coexisting retinoid were examined. As a comparative or coexisting retinoid, Am80 ([4-[(5,6,7,8-tetrahydro-5,5,8,8-tetramethyl-2-naphthalenyl)carbamoyl]benzoic acid] was used. Promyelocytic leukemia cell strain HL-60 was used, and differentiation into granulocytic cells was determined by observing morphological change and measuring ability to reduce nitroblue tetrazolium (NBT). The ratios of differentiated cells shown in the following tables were calculated from the ability to reduce NBT.

(A) Concentration-dependent differentiation-inducing ability of each compound alone and concentration-dependent effect on the differentiation-inducing ability of 1×10^{-9} M Am80 were measured. Each of TZ91 and TZ181, per se, had cell differentiation ability, and enhanced the activity of the coexisting Am80 at a concentration which did not give the cell differentiation-inducing ability. TZ201 itself was found to be inactive, whilst it suppressed the activity of the coexisting Am80.

(B) Concentration-dependent differentiation-inducing ability of each compound alone and concentration-dependent effect on the differentiation inducing ability of 1×10^{-10} M Am80 were measured. TZ151, per se, had cell differentiation ability, and enhanced the activity of the coexisting Am80 at a concentration which did not give the cell differentiation inducing ability. TZ161 and TZ191 per se were found to be inactive, they enhanced the activity of the coexisting Am80, and acted to suppress the activity at a high concentration (1×10^{-6} M).

(C) Concentration-dependent differentiation-inducing ability of each compound alone and concentration-dependent effect on the differentiation inducing ability of 3×10^{-9} M Am80 were measured. Tested compounds except for

TZ241 had cell differentiation ability when used alone, and all of the five compounds enhanced the activity of the coexisting Am80 at a concentration which did not give the cell differentiation inducing ability.

(D) Effect on concentration-dependent differentiation-inducing ability of the retinoid Am80 was measured with a fixed concentration of each compound at 1×10^{-6} M. Each of the following four compounds did not have cell differentiation ability when used alone, and suppressed the activity of the coexisting Am80.

(E) Japanese Patent Unexamined Publication No. (Hei)9-48771/1997 discloses that N-benzylthiazolidylbenzamide derivatives represented by the following general formula have an action of improving insulin resistance. For comparison, TZ105 as an N-benzyl derivative was synthesized, and examined whether or not the compound has the retinoid activities.

[0140] Compound II-2 (see, Example 4, 150 mg, 0.60 mmol) was suspended in anhydrous benzene (12 ml), and the suspension was added with SOCl_2 (358 mg, 3.01 mmol), and refluxed for 14 hours. After SOCl_2 was evaporated,

the residue was suspended in anhydrous benzene (10 ml), and the suspension was added with 4-trifluorobenzylamine (106 mg, 0.60 mmol) and anhydrous pyridine (1 ml), and stirred at room temperature for 1 hour. The reaction mixture was added with 2 N hydrochloric acid with floating ice, and extracted with ethyl acetate. The organic layer was washed with brine, dehydrated over MgSO_4 , and concentrated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 3:2) to obtain TZ105 (128 mg, 52 %).

TZ105: Colorless needles (ethyl acetate/n-hexane); mp 204°C; $^1\text{H-NMR}$ (400 MHz; DMSO-d_6 , 30°C) 9.23 (t, 1H, $J=5.9\text{Hz}$), 8.10 (s, 1H), 7.97 (d, 1H, $J=8.7\text{Hz}$), 7.83 (s, 1H), 7.76 (d, 1H, $J=8.7\text{Hz}$), 7.70 (d, 2H, $J=8.1\text{Hz}$), 7.65 (t, 1H, $J=7.7\text{Hz}$), 7.55 (d, 2H, $J=8.0\text{Hz}$), 4.59 (d, 2H, $J=5.9\text{Hz}$); Anal. Calcd. for $\text{C}_{19}\text{H}_{13}\text{N}_2\text{O}_3\text{SF}_3$, C: 56.16%, H: 3.22%, N: 6.89%, Found, C: 56.36%, H: 3.04%, N: 6.98%

[0141] In the aforementioned assay system using HL-60 cells, TZ105 was completely inactive in the differentiation inducing activity, and also failed to effect the activity of the coexisting retinoid Am80. Therefore, it is considered that N-benzyl compounds have no retinoid activity or no activity of controlling retinoids, and the presence of an aromatic ring on the nitrogen atom, such as seen in TZ185 and the like, is essential in the skeleton.

Industrial Applicability

[0142] The compounds of present invention act on the retinoid receptor and have retinoid-like activities, action of controlling retinoids (enhancement or suppression of retinoid activities) and the like. Therefore, they are useful as active ingredients of medicaments for preventive and/or therapeutic treatments of diseases such as cancers, diabetes, arteriosclerosis, bone diseases, rheumatism, immunological diseases and the like.

Claims

1. A compound represented by the following general formula (I):

wherein R^1 , R^2 , R^3 , R^4 , and R^5 independently represent hydrogen atom or a lower alkyl group, or two adjacent groups selected therefrom may combine together with carbon atoms of the phenyl ring to which they bind to form a 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups; and X represents a group represented by $-\text{C}(\text{R}^6)=\text{CH}-$, $-\text{CH}=\text{C}(\text{R}^7)-$, $-\text{N}(\text{R}^8)\text{CO}-$, $-\text{CO}-\text{N}(\text{R}^9)-$, $-\text{C}(=\text{CHR}^{10})-$, $-\text{CO}-$, or $-\text{NR}^{11}-$ wherein R^6 , R^7 , R^8 , R^9 , R^{10} , and R^{11} independently represent hydrogen atom or a lower alkyl group, or

a compound represented by the following general formula (II):

wherein R^{21} , R^{22} , R^{23} , and R^{24} independently represent hydrogen atom or a lower alkyl group, or two adjacent groups selected therefrom may combine together with carbon atoms of the phenyl ring to which they bind to form a 5- or 6-membered ring which may optionally be substituted with one or more alkyl groups; and R^{25} represents hydrogen atom or a lower alkyl group, or a salt thereof.

2. A medicament comprising a substance selected from the group consisting of a compound represented by the formula (I) or formula (II) according to claim 1, a physiologically acceptable salt thereof, and a hydrate thereof and solvate thereof.
3. The medicament according to claim 2, which is an agent acting on a retinoid receptor.
4. The medicament according to claim 2 or 3, which has an action of enhancing an activity of a retinoid.
5. The medicament according to claim 2 or 3, which has an action of suppressing an activity of a retinoid.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Regarding the inventions of claims 1 to 3, compounds represented by the formula (I) include ones having the effect of increasing retinoid actions and ones having the effect of suppressing retinoid actions, whereas compounds represented by the formula (II) are ones having the effect of suppressing retinoid actions. Since the effect of increasing retinoid actions and the effect of suppressing retinoid actions both as the technical feature are contradictory to each other, it is not considered that all of the alternative descriptions disclosed in each of claims 1 to 3 have a common nature or activity. Such being the case, these two inventions are not considered as relating to a group of inventions so linked as to form a single general

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
